Eniversal PRD

Nov 1, 2026 · @nivas salla

Summary

Eniversal is one place for student builders to post, talk in depth, get matched, launch projects and meet at events. It combines jobs that LinkedIn, Reddit, Tinder and Luma each do separately.

The whiteboard is the only source for this PRD. It gives the structure but little explanation, so anything labelled "my reading" is an inference to confirm. Uncertain handwriting is listed in the last section.

Problem and insight

Each incumbent owns one useful job, so a student builder has to stitch several products together. The sketch also marks LinkedIn's messaging, posting and "glorification" as byproducts of networking, not its point.

Product	On the sketch	What Eniversal takes (my reading)
LinkedIn	Networking, with messaging, posting and glorification as byproducts	Messaging and posts, without the status display
Reddit	Convos, leading to deep convos	Groups built for long, specific discussion
Tinder	Matching	Matching people, applied to builders rather than dating
Luma	Individuals, landing page, auth or third party, waitlist	Simple launch pages and sign-ups
Luma or Whop	Custom page, host event	Custom event hosting

The sketch also shows an 18-year-old's post beside "$1B", "AI", "0.01%" and "0.000001%". My reading: today's networks bury rare young talent, and Eniversal should surface it from what people post and build.

Target users

The first user is the student builder, the phrase underlined on the board. My reading is someone around 18 who is making projects and wants collaborators, feedback and visibility.

The first community looks like AI and cyber, which is circled several times beside the event. The sketch does not say whether non-students or investors are in scope.

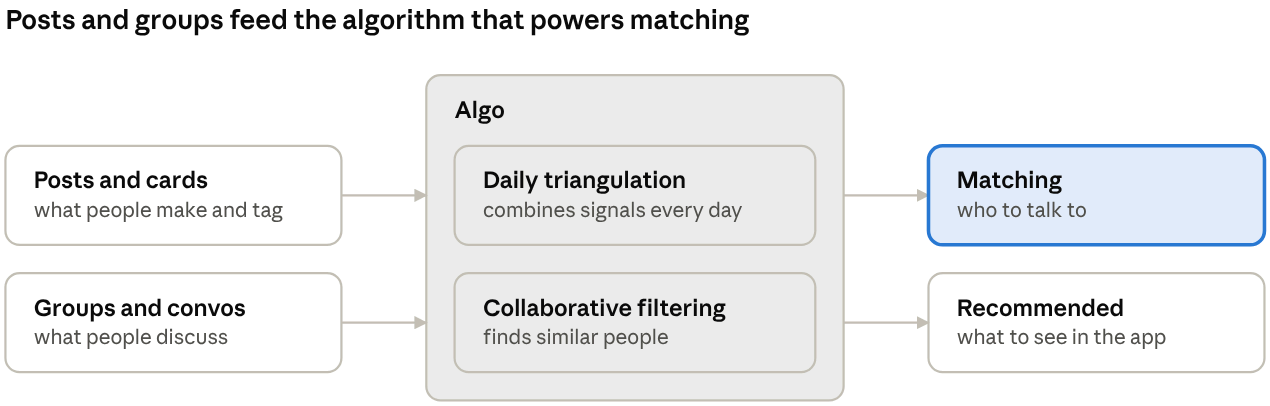

Core product

The red box on the board defines the core: messaging and posts, deep convos, and launch. Posts turned into cards and groups are ticked, so I read those as decided.

Module	On the sketch	Requirement (my reading)
Posts and cards	Post to cards, you to cards, ticked	Each post appears as a tagged card, and a person's cards form their profile
Groups and convos	Boxed and ticked, fed by deep convos	Topic groups hold long threads
Messaging	Inside the red box	Direct messages, likely opened after a match
Matching	Tinder to matching, then CF	People are recommended from their activity
Launch	Launch to app, features, funding and challenges	A project page shows the app, its features and what it needs
Projects	"Project" circled and ticked	Projects are a first-class object, linked to posts and people
Discovery	Idea, recommended and search all point to the app	Users can browse ideas, see recommendations and search
Events	Custom page, host event, 100 to event	Members can host events with sign-up and waitlist

Matching and recommendations

Matching runs on what people do, not what they claim. On the board, posts and groups lead to an algorithm made of daily triangulation and collaborative filtering (CF).

matching and recommendations · my reading of the board

My reading of daily triangulation is a daily job that combines a person's posts, groups and past matches into a short list of people to meet. The one-line descriptions and the link to recommendations are also my reading.

Collaborative filtering needs activity data, so it will work poorly with the first 100 users. Early matches should rely on tags and shared groups until that data exists.

Go-to-market

The launch number is 100: it appears against posts, cards, people and the event. My reading is a small seeded launch in this order:

1. Seed the product with 100 posts, so the first users find real content.
2. Bring in 100 student builders and turn their posts into cards.
3. Host a 100-person AI and cyber event to concentrate the first community.
4. Use the sign-ups and activity from that event as the first matching data.

Build plan

The board starts from a barebone version, which leads to an MVP and to UI/UX work. It gives no dates or feature cut, so the split below is my proposal.

1. **Barebone:** sign-up, posts as cards, groups, search.

2. **MVP:** messaging, project pages, event hosting, first matching from daily triangulation.
3. **UI/UX:** a design pass once the barebone flows have been used.

Success metrics and non-goals

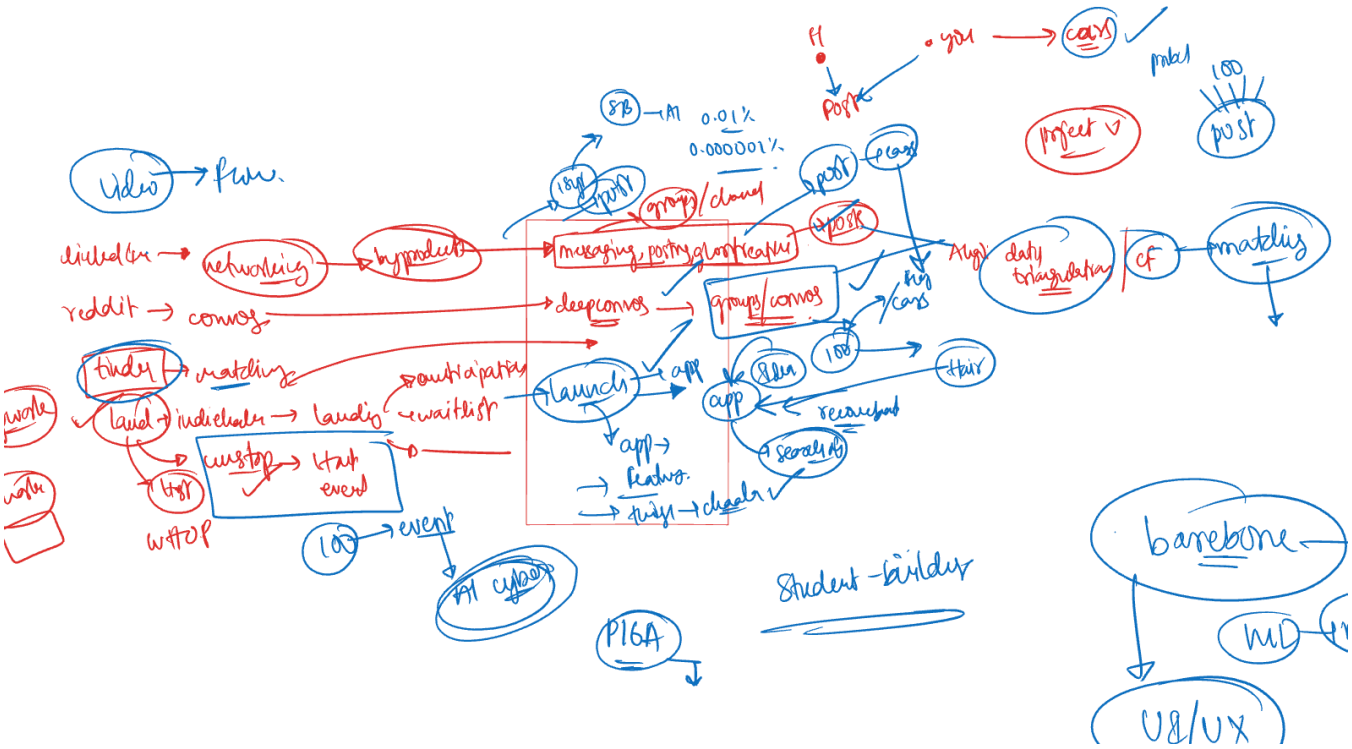

The only targets on the board are the 100s: 100 posts, 100 people and a 100-person event. Everything else here is a proposed measure without a target.

- **Launch:** the three 100 counts above.
- **Conversation:** share of posts that lead to a real group discussion.
- **Matching:** share of recommended matches that lead to a message.
- **Building:** projects launched on Eniversal.

Proposed non-goals are a general professional network, status-driven posting and any audience beyond student builders at launch.

Uncertain readings and open questions

These readings could change the requirements, so please correct any I got wrong. The left and right edges of the photo are also cut off, which hides some words.

On the board	I read it as	Could also be
"Luma" (circled next to Tinder)	Luma, the events product	Another product name
"wHOP"	Whop, the creator and community platform	Unrelated note about hosts
"cars"	Cards	Categories
"glorification"	Status display on LinkedIn	Another word
"group/channel" above the posts box	Groups or channels	Groups or clones
"funding, challenges" under launch	Funding and challenges for a project	Another pair of words
"auth/3rd party" by waitlist	Third-party sign-in or landing pages	Another phrase
"their" after 100	100 people bringing their own work	"Hair" or an unrelated word
"PIGA" with an arrow	Unknown	An acronym or a name
"Video to free"	Video is free or a later feature	Another phrase
"model" near 100 posts	A model trained on the first 100 posts	Another word

- [ ] Is "Eniversal" the final spelling, or was "Universal" intended?
- [ ] Does matching connect people to collaborate, to hire, to invest, or all three?
- [ ] What data powers matching before there are enough users for collaborative filtering?
- [ ] Is this a mobile app, a web app or both?
- [ ] Is access limited to verified students?
- [ ] Is there a revenue model? The board shows none.
